About Imco International

Imco International is a professional company and brand who offer a large range of ductile iron pipes, fittings & valves for water distribution, waste water treatment and fire protection.

Our ductile iron pipes & fittings are produced in China using high-tech modern equipment which is inspected regularly to meet both our high standards and industry standards ensuring that the quality of our products is very high. Our production process caters for sizes from DN80 up to DN2600 according to ISO2531, EN545, EN598 or other internationally recognised equivalent standards. For internal linings and external coatings, we offer a large variety of solutions including fusion bonded Epoxy, Bitumen, Polyurethane and others, the majority of which are WRAS approved.

The history of Imco International as a brand dates back to 1967 and since then, we have developed a wide range of products for the water industry. Our emphasis on high quality, reliability and customer service has helped Imco International to maintain our position at the forefront of the market in many parts of the world. All products supplied by Imco International are quality controlled to European or equivalent standards and consistently spot-checked in order to guarantee high quality. We believe this is one of the reasons why many of our clients have continued to use Imco International for decades.

Our products have been successfully installed in 22 countries across the world.

Our company follows the philosophy of having empathy and a connection with the clients' needs. Therefore, we try to understand your needs better than any other company. We also believe that a high level of business ethics together with transparency helps to maintain trust between our valued clients and Imco International.

Helping to create sustainable water supply across Africa and Asia

1 in 3 people globally do not have access to safe drinking water – World Health Organisation, 2019

Water is a valuable and under appreciated resource which must be protected. In order to improve network performance and save precious water resources, at Imco International we strive to work with clients' requirements. Using cutting edge technology alongside high quality materials we develop a wide range of products which produce highly reliable solutions, reducing and protecting against leakage.

In addition to this commitment to the development of our products we also ensure that both we and our partner factories uphold the highest standards with regards to safety as well as to the environment.

Advantages of Ductile Iron

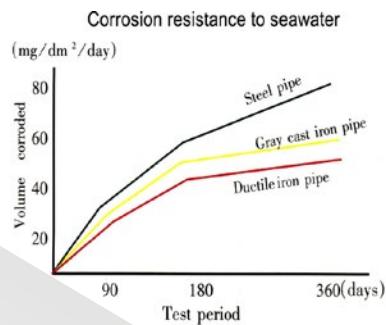

Ductile iron pipes are made from spherical graphite cast iron using a centrifugal spinning process. In conjunction to this, our ductile iron fittings utilise the lost-foam casting process together with induction melting processes. This manufacturing technique ensures that fittings are dimensionally accurate and also provides a good surface quality of the final cast fittings. Imco International's ductile iron pipes & fittings can convey many fluid medias such as water, oil and gas and are widely used in pipeline projects for water conservancy, metallurgy, mining, petroleum and public service utilities.

Ductile iron on its own has better mechanical properties than steel or grey cast iron as demonstrated in the following table:

Type of Pipe	Mechanical Properties		
	Tensile strength	Elongation (%)	Hardness (HB)
Ductile Iron Pipe	≥420 N/mm ²	(DN≤1000) ≥10 (DN>1000) ≥7	≤230
Grey Cast Iron Pipe	150-260 N/mm ²	Negligible	≤230
Steel Pipe	≥400 N/mm ²	≥18	Approx. 140

High Corrosion Resistance:

Better corrosion resistance than Steel pipe and Grey cast iron pipe:

Type of Pipe	Corroded volume when merged into sea water (gr/cm ²)	
	After 45 days	After 90 days
Ductile Iron pipe	0.0060	0.0090
Gray Cast Iron pipe	0.0060	0.0103
Steel Pipe	0.0294	0.0396

Mechanical Properties Ductile Iron Pipes:

The mechanical properties of pipes will be as shown in the table:

Type of Cast	Minimum Tensile strength	Minimum Elongation Percent After fracture		Hardness Max.(HB)
	DN80-2600	DN80-1000	DN1100-2600	
Pipes centrifugally cast	420 MPa	10 %	7 %	230
Pipes not centrifugally cast, fittings and accessories	420 MPa	5 %	5 %	250

Note:

1. By agreement between manufacturer and purchaser, the 0.2% proof stress may be measured. It shall be not less than 270 MPa when A ≥12% for DN80-1000 or 10% for DN > 1000

2. For centrifugally cast pipes of DN80 to DN1000, the minimum elongation after fracture shall be 7% for thickness classes greater than K12

Quality Control**Hydrostatic test pressure at works:**

Pipes and fittings are subjected to a hydrostatic test for a duration of at least 10 seconds at the minimum internal test pressure given in the table:

DN (mm)	Minimum work test pressure (Bar)			
	Pipes centrifugally cast		Pipes not centrifugally cast and fittings	
	K<9	K≥9	Class C	All thickness classes
≤ DN300	0.5(k+1) ²	50	Equal to the pressure class	25 ²
350–600	0.5k ²	40		16
700–1000	0.5(k-1) ²	32		10
1200–2000	0.5(k-2) ²	25		10
2200–2600	0.5(k-3) ²	18		10
<ul style="list-style-type: none">• The works hydrostatic test pressure for fittings is less than that for pipes because the shape of fittings makes it difficult to provide sufficient restraint to high pressure during test.• 16 bar for pipes and fittings with PN10 flanges.				

- Design flexibility: Ductile iron pipes will safely function over a wide range of operating pressures, trench loads and installation conditions. A range of protective paints or coatings can ensure the pipes and fittings are suitable for even the most aggressive soil conditions.
- Easier Handling: Ductile iron pipes and fittings can be more easily manoeuvred under and around existing underground obstacles, therefore eliminating unnecessary changes in line or grade.
- Superior Joints: Easily assembled push in joints speed up the projects' progress and minimise installation costs. Our joints remain leakproof under all operating pressures.
- A complete range: Ductile iron pipes are available with a complete range of fittings and accessories up to DN2600 along with a large variety of coatings.

Quality Control

Ductile iron pipes & fittings are subjected to tests and inspections at factory, including composition metallographic examination, composition analysis, surface finish & dimension inspection, tensile test, ring test, hardness test, hydrostatic test, lining and coating test to ensure that all products meet the full requirements of relevant standards. In addition to the standard tests and inspections Imco International also offer the option of further inspection by an independent and reputable inspection company such as SGS.

In addition to this, all coatings, linings and rubber gaskets are WRAS approved.

Standards and Options

Anti-corrosion coatings and linings for pipes & fittings

Special coatings can be applied on the external and internal surfaces of both ductile iron pipes and fittings, in order to protect water resources. Without these, due to the corrosivity of the soil or aggressive mediums such as waste water or salt water, after the products are laid, over time the outer and inner walls of the pipes or fittings may begin to rust due to the long-term exposure to these mediums. In turn this may lead to a leak within the system and precious water resources could be wasted. We recommend a variety of special coatings as follows:

- Portland Cement: Our most commonly used lining for both Ductile iron pipes and fittings is a portland cement mortar protective layer according to ISO4179. High quality and strictly tested cement raw materials are selected, in order to ensure that the mortar is very solid, dense and smooth.
- High sulphate-resistant cement: Has a higher corrosion resistance to highly corrosive mediums such as seawater.
- High aluminium cement: For waste water or rain water applications and is according to ISO7186, EN598 and GB/T26081.
- Fusion bonded epoxy: Commonly used only for fittings internally and externally it has enhanced corrosion resistant properties. It is applied to a minimum of 250 microns according to EN14901. Available in blue (for water) or red (for sewage) colours.
- PE liner: For pipes, this is a new type of pipe material. A thin wall of polyethylene is applied on the inner wall of the pipe. It combines the advantages of both ductile iron and polyethylene pipes together which not only has good mechanical properties, but also has good corrosion resistance.
- Polyurethane lining: For pipes or fittings is according to EN15655.
- Zinc + bituminous paint: A layer of metallic zinc is first applied (min 200g/m² – which represents a significant increase over European standards which prescribe 130g/m²) followed by a bituminous paint finish or equivalent (minimum thickness of 70 microns) according to ISO8179.
- Polyethylene sleeving: A tubular film of polyethylene is slipped over and fitted to the pipe at the time of installation. It can be used as a supplementary protection over and above original coatings for highly corrosive soils or in the presence of stray currents and is according to ISO8180.

The majority of our linings and protective coatings are WRAS approved. For pipes and fittings we can also supply additional bitumen paint for touching up on site if any common impact damage has occurred during transportation. See page 86 for guidelines on transportation and storage.

Coating	External anti-corrosion coating	Internal anti-corrosion coating
Conventional coating	Zinc coating+ external bituminous coating	Cement mortar
Strengthening coating	Zinc coating+ external bituminous coating + polyethylene pipe sleeve and polyurethane coating	Polyurethane coating, epoxy resin coating, epoxy ceramic coating, cement + epoxy resin lining, PE coating
Special coating	To be determined by the site conditions	To be determined by the site conditions

Standards and Options

Ductile iron pipes and fittings are manufactured according to ISO 2531, EN545 or GB13295. EN598 is also available for waste water applications. Pipes and fittings are available in PN10, PN16, PN25 or PN40 pressure ratings. Thicknesses are to K9, K10, K12, K14 or C class. Imco International can offer a variety of connection solutions, depending on the clients' requirements such as self restrained (locking) joints, socket spigot and flanged. Flanges are according to EN1092-2.

**Calculation formula of K-grade pipe wall thickness**

Wall thickness calculation formula:	$e=K(0.5+0.001DN)$
e:	Nominal wall thickness, mm, (minimum nominal wall thickness is 6mm)
DN:	Nominal diameter, mm
K:	Wall thickness grade, integer: 7,8,9,10,11,12
Minimum wall thickness:	When e = 6mm, the minimum wall thickness is 4.7mm When e > 6mm, the minimum wall thickness is e - (1.3 + 0.001DN) mm

Pipe weight calculation formula

Pipe weight calculation formula:	$3.14 \times \{ [(DN/2,000)^2 - (DN-2e)^2 / 2,000]^2 \} \times 6 \times 7,050 + \text{socket weight}$
Pipe weight calculation formula:	Pipe weight = straight pipe weight + socket weight
Straight pipe weight	Straight pipe volume \times density Density: 7,050kg/m ³
Straight pipe volume:	Volume of outer circle - volume of inner circle
Volume of outer circle	$3.14 \times (DN/2,000)^2 \times 6$
Volume of inner circle:	$3.14 \times [(DN-2e)/2,000]^2 \times 6$
Unit conversion:	1000mm = 1m

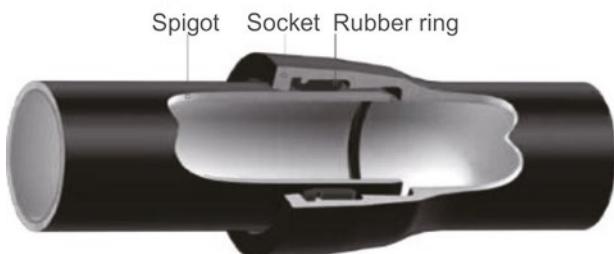

Hydraulic pressure

Specification DN	Minimum pressure at K = 7 (Mpa)	Minimum pressure at K = 8 (Mpa)	Minimum pressure at K = 9 (Mpa)	Minimum test pressure of class C pipe (Mpa)	
				Recommended pressure rating	Pressure
DN80-DN300	3.2	4.0	5.0	C40	4
DN350-DN600	2.5	3.2	4.0	C30	3
DN700-DN1000	1.8	2.5	3.2	C25	2.5
DN1100-DN2000	1.3	1.8	2.5		
DN2200-DN2600	0.8	1.3	1.8	C25	2.5

Ductile Iron Pipe Joints

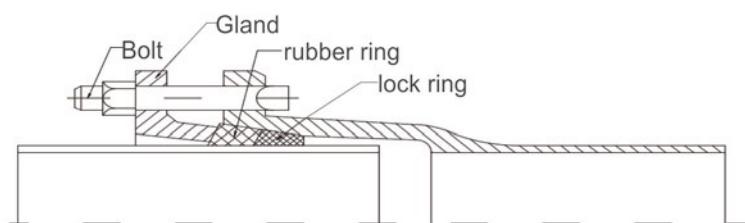

T-type joint

This is a common joint for ductile iron pipes. The rubber ring is divided into soft rubber and hard rubber. Due to the existence of soft rubber part, T-type joint also allows certain angle deflection.

N1-type joint

N1-type ductile iron pipe joint includes bolt, thermal polymer, sealing rubber rings and lock ring.

Internal self-anchored joint

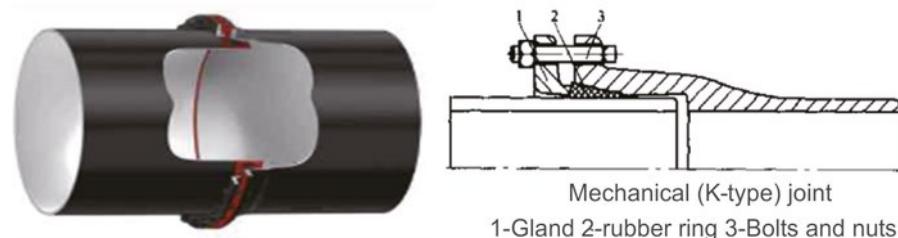

By the thrust transfer between the self-anchored assembly and the socket welding ring, the reliable anti-shedding performance and good deflection performance are realised. In general self-anchored joints feature flexibility and good deflection performance. The self-anchor joint can transfer the axial force to each other. Through the friction and passive earth pressure generated by the pipeline and the surrounding soil, it can effectively counteract the hydraulic thrust generated by axial and radial direction, so it can replace the function of restraining block and realise the design of non-restraining block, with simple structure and high bearing capacity. It is mainly used in cases where space, time or economic conditions are not suitable for the setting of restraining block; that there is a certain foundation settlement, or the slope of pipelines laid on the ground exceeds 20% or the slope of underground pipelines exceeds 25%. Imco International can provide a variety of installation methods as well as technical advice.

Ductile Iron Pipe Joints

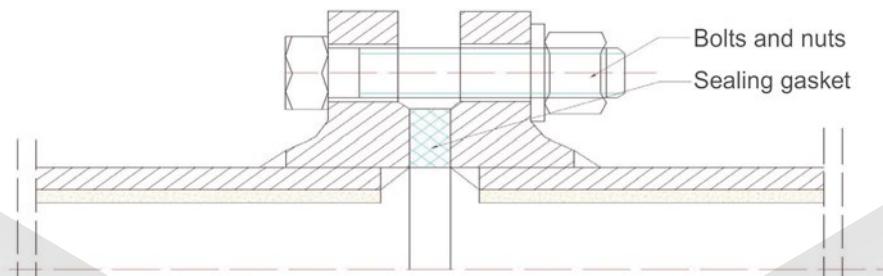

K-type joint

The sealing principle is stated as below: the pressure is transmitted to the gland and then to the rubber ring through bolt fastening, which is sealed after the rubber ring is compressed. It is used in the large diameter pipeline of DN1600-DN2600.

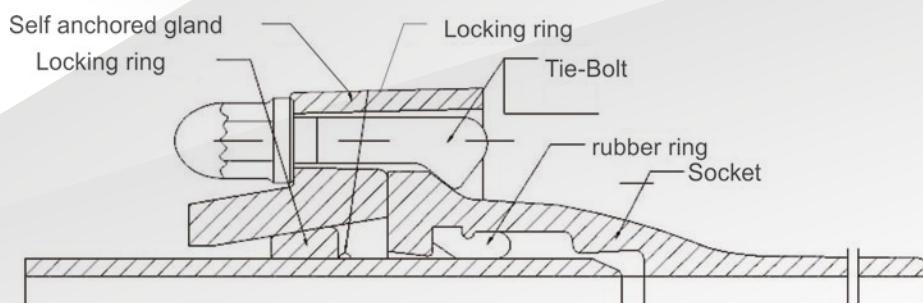

Welded flange joint

The flange joint is sealed by tightening the bolts to make the flange squeeze the sealing ring, it has good sealing performance and is usually used for certain criteria, for example when it is necessary to connect with pump, valve, fire hydrant and pass through foundation, wall and other special needs.

External self-anchored joint

It is evolved from T-type joint. In addition to the advantages of T-type joint, the strong sealing of the joint under high pressure is the highlight.

Rubber rings

Rubber rings are one of the indispensable accessories in the installation of ductile iron pipe, and they must be used for sealing when installing ductile iron pipes. The rubber rings used for centrifugal ductile iron pipe are specially developed for ductile iron pipe installation. The quality of rubber rings are directly related to the safety of ductile iron pipe engineering. There are many advantages of rubber rings, such as good anti-seismic properties, suitability for direct pipe installation with a small radius bend, good sealing performance of joint, strong adaptability to foundation deformation and no water leakage in certain corners.

Special Fittings & Fabrications

For non standard and bespoke requirements we can offer a wide variety of solutions. Beginning with the design we can assist clients with technical advice, CAD drawings and support.

Imco International can also supply valves, tapping saddles, penstocks and other similar products relating to water projects.

Business Performance and History

Imco International has won wide recognition as a leading supplier of ductile iron products and has cultivated a number of loyal customers with its high quality products and exemplary service. Adhering to the ethos of having empathy and a connection to the clients' needs, the company has dedicated staff that are loyal to this core principal. Imco International's products are successfully installed in 22 countries across the world. There is a relatively large international demand, especially in Asia & Africa as well as clients in Europe and the United Kingdom. Imco International is proud to supply a wide variety of clients including a famous UK ductile iron brand, well established multinational construction & civil engineering companies and various trading companies. We have a history of strong performance and achievements since our founding in 1967.

In 1979 Imco International provided the 5th Arabian Gulf football cup and medals to the winning team in Iraq

Ductile iron pipes supplied for Doma Irrigation project – Nigeria – 1991

Multiple shipments of ductile iron pipes, fittings & valves including 14628m³ of ductile iron pipes for Bauchi Water supply project 2019-2020

Multiple shipments of ductile iron fittings and valves for several projects, supplied to a Chinese contractor in Zambia & Mozambique 2006 – present

Ductile iron fittings, pipes, valves and penstocks for Ero Dam Water treatment plant rehabilitation 2020

Ductile iron fittings according to EN598 for a well established European brand, destined for an Iraqi project – 2021

Transportation and Handling of Ductile Iron Pipes & Fittings

Whilst ductile iron pipes and fittings are not generally susceptible to damage by impact, adverse handing or storage can result in damaged coatings or linings.

Pipes should be loaded with reasonable care and secured to the means of transportation during transit to prevent any movements, especially against other pipes or fittings.

Any sharp edges on the transportation vehicle should also be padded to avoid any damage, this means securing should be assigned and considered in order to minimise any damage to the coating.

Fitting slings or lifting beams with correctly padded hooks should always be used when offloading pipes using cranes. The pipes or fittings diameter, type of staking, outreach required and site conditions should be taken into consideration when determining the suitability of lifting equipment.

**Storage**

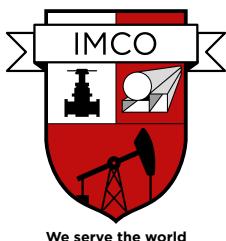

Ductile iron pipes should not be stored in direct contact with the ground. We recommend using a wood bearer with a minimum height of 100mm from the ground. Care should also be taken when storing in terms of stacking and, in particular, consideration should be made to making sure tiers always follow the opposite direction. As shown in the photograph below, socket joints are all adjacent in the first tier to the front of the image, whilst in the second tier the socket joints are all adjacent to the rear of the image. This ensures that the spigot does not make contact with the bell of the socket.
